Introduction

In recent times, online platform for different services is becoming very popular in our daily life. The users seek to have a one stop website for all kind of services. For example, plumber, electrician, lock-repairs etc. From the other side, the workers who seeks job for their own, also want a platform to provide their services. In the thought of linking these two sites, I come up with an idea name one-stop service providing solution. An online platform to link the customers with their service providers. For the perspective of Bangladesh, there is a huge scope for this kind of services.

Functionality

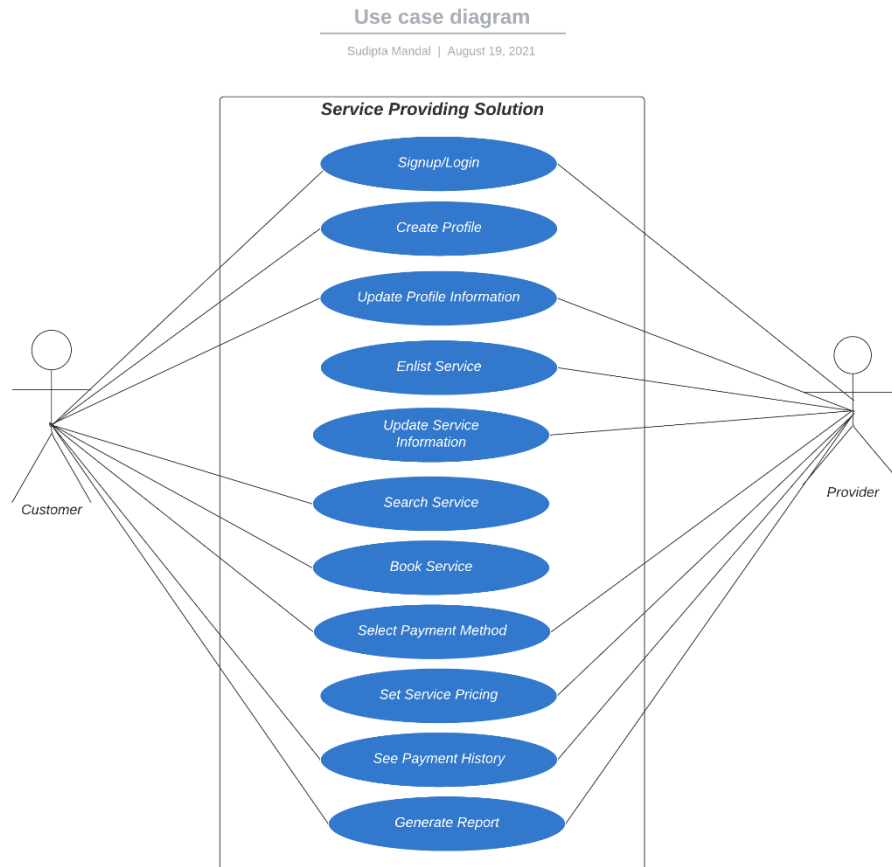

- Sign in/Registration
- Sign in as a customer
- Sign in as a worker
- Add service as a worker
- Customize worker profile
- Category Page to find all the services together
- Find a worker as a customer

Methodology

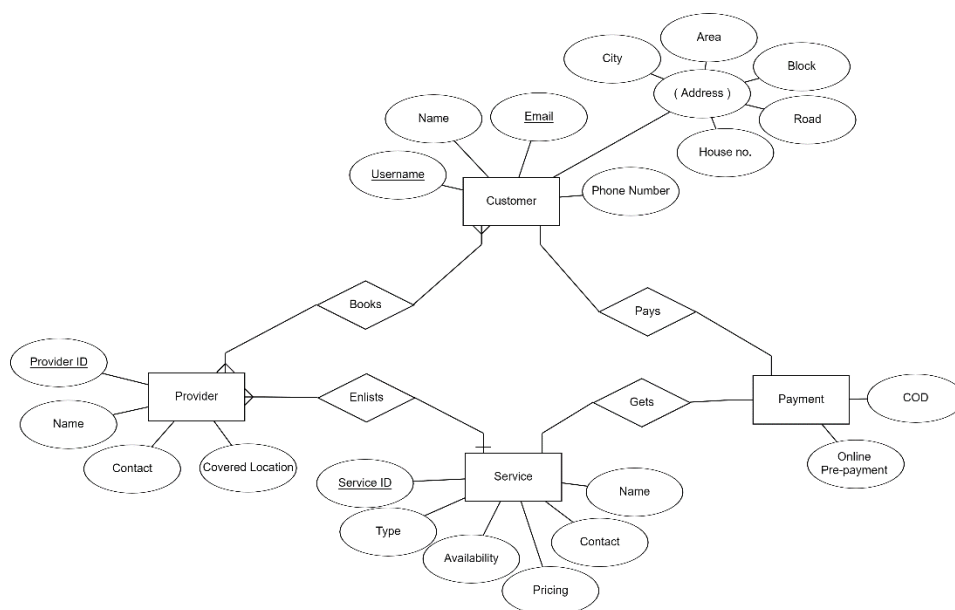

- HTML
 - PHP
 - CSS
 - JavaScript
 - MySQL
 - APIs

Future Work & Vision

For the semester being too short here are some things I am going to work on in future on the website.

- Location based service – user friendly search system
- Bidding service – have a plan to add a bidding service for listed works. Workers can set bidding price and
- Scheduled video call – want to add a video call service to connect the customer and provider so that they can discuss issues and pricing face to face.
